

RoscoVision

Rosco Vision System Recording Time

The standard SD card is 64GB. With a framerate of 7 per second, you can record approximately 200 hours. The system can be set to loop record over the oldest data.

The event button is used to capture and save video when the camera may not have created an exception video. There is an orange button on the side of the camera to log an event or an external event button can be utilized. Once pressed a clip is created and transmitted to the cloud for 10 seconds before and 10 seconds after the event is generated by the driver.
