## Configuring Driver Feedback

### Driver feedback

Making it easy for your drivers to immediately improve their on-road driving behavior, the in-vehicle audible alerts notify drivers of unsafe or potentially risky driving events. Once the driver has corrected their actions, for example by reducing their speed or fastening their seat belt, the interactive in-vehicle alert will cease to notify them. This helps your organization develop a fleet-wide safety program that works without intervention. Your fleet managers can review this information with real time reporting and be notified when events occur through by email and text messages. Reports)
