

Application

Auxiliary Rules in Geotab

Auxiliary rules allow you to manage connected external input devices and sensors to the Geotab GO Device through a familiar rule based approach. These rules integrate seamlessly with the live map and are displayed in real time.

Note: Auxiliary Rules were formerly known as Auxiliary Groups.

As an example, assume your Geotab GO Device has auxiliary 1 connected to your driver side door and is activated whenever it is opened. In MyGeotab, you would now configure an auxiliary rule named “Door Open” in the place of “Aux1” for the corresponding vehicle.
